How to get your Students to Prepare for Every Class

Just-in-Time Teaching (JiTT)

A. Gavrin, IUPUI

http://webphysics.iupui.edu/nfw_summer18/index.html
A few of your comments

• Strawberry: “I would like to know how to develop warm-up exercises. Where can I find examples?”
• Star Wolf: “… For a large class, it seems like it would take a lot of prep time to sort through all the responses…”
• qc: “Example warmups for physics lectures, grading of warmups, avoiding copying, how to efficiently keep track of warmup responses to minimize time required to review them”
A few more

- Marceline: “…Some people have used flipped classrooms (with online videos) in my department which has an element of JiTT,…”
- Prof D: “…maybe this would get them to read the book but it may just be seen as a nuisance….”
- Paul: “How do you actually structure class time to address the questions that came up during class? How large a classroom (# of students) can this be effective with? If there are more students, discussions become very difficult,…”
Outline

• Introduction
• Implementation
• Getting student great evaluations
• Final thoughts
Goals

• Give you a JiTT “experience”
• Give you a sense of why JiTT is effective
• Enable you to put JiTT into practice
• Introduce you to some resources
• Prepare for the “Going Deeper” session
The (original) settings

- **IUPUI: Large, public, urban university**
  - 30,000 students, almost 100% live off campus
  - Most work > 25 hours/week
- **US Air Force Academy: Military College**
  - All students take physics, even history majors
  - All play sports, train for military
- **Davidson College: Small liberal arts college**
  - Highly selective
  - Small classes
Outline

• Introduction ✓
• Implementation
  • What JiTT is
  • What makes a good warmup exercise
  • Using students’ responses
• Getting student great evaluations
• Final thoughts
What is JiTT?

- Green: “Adapting lecture based on work students do to better address what they're confused about.”
- Gordon Freeman: “Small questions/assignments/prep work due a little before class that allows learners to get a sense of what they'll be covering and gives the lecturer an idea of how best to direct their efforts.”
- R: “JiTT is optimally utilizing the time a student spends outside of class by giving them small assignments due directly before the class period which both guide the student's studying as well as better prepare the instructor to address student misconceptions in class.”
Digression

- JiTT described in your words
- “preview” of important concepts
- Jargon already familiar (JiTT, Warmup)
- Big idea (connect class to HW) already present
Lightning summary

• Use **Warmup exercises to**
  • Motivate and improve preparation
  • Help faculty focus class

• **WarmUp = Online, pre-class reading quiz:**
  • Due few hours before class
  • A few open-ended conceptual questions
  • Cover that day’s material
  • Provide “conversation starters”
Just-in-Time Teaching (JiTT)

World Wide Web

Homework  Classroom

Assignment Design
Example

• *Question*: *Is it possible to add heat to an ideal gas without changing its temperature? If it is possible, please explain how it is done.*
  
  • “It is not possible because the internal energy of an ideal gas only depends on the temperature.... the internal energy will increase when the temperature rises....”
  
  • “If you add heat to a system while the system is doing the corresponding amount of work, the temperature will not change.”
  
  • “It is possible to add heat to an ideal gas without it changing its temperature by the gas receiving the heat, and the atoms of that gas getting excited enough to disperse that heat as fast as they receive it...”
More Examples

• In a few sentences, explain what an "impulse" is, and how it can be calculated.

• A Ford Mustang weighs about 3500 pounds, and can accelerate from 0-60 MPH in about 5 seconds. What force is responsible for this acceleration? What is its approximate magnitude?

• In a sentence or two, please describe the difference between "gauge pressure" and "absolute pressure? When would you want to use each?
Impulse responses

- impulse is the change in momentum over time. It can be calculated by integrating force as a function of time.
- ...its the force integrated over the time period or the change in momentum in that time period.

- An impulse is a large amount of force that acts on an object of a short amount of time.
- An impulse is the moment at which two objects initially collide and exert enormous force upon each other.
What does the book say?

**IMPULSE**

When two objects collide, they usually exert very large forces on each other for a very brief time. The force exerted by a baseball bat on a ball, for example, may be several thousand times the weight of the ball, but this enormous force is exerted for only a millisecond or so. Such forces are sometimes called *impulsive forces*....

What makes a good Warmup?

- Robert: “Thought provoking and difficult, but not impossible. Something that the student feels comfortable starting and can make headway with, but maybe can't complete in its entirety without asking a question to the professor.”

- Andy: “I think it is good for students to have already at least heard a "new" term, like momentum, before coming to class, and have briefly familiarized themselves with it. The warmups shouldn't be too hard. Ideally, the warmups should also be interesting.”
Online archive of Warmup exercises

http://webphysics.iupui.edu/warmup/physics_archive.html

• Introductory physics (2 semester sequence)
• Statistical/Thermal Physics (2 sets)
• Intermediate Mechanics (2 sets)
• Modern Physics, Quantum Mechanics
• Intermediate E&M (2 semester sequence)
• Mathematical Methods
• Optics, Intro Astronomy
• Needed: Condensed matter, other specialties…
Test drive

- Write one warmup question you can use.
- Target the course you will likely teach next
- You have three minutes, go!
Outline

• Introduction ✓
• Implementation
  • What JiTT is ✓
  • What makes a good warmup exercise ✓
  • Using students’ responses
• Getting student great evaluations
• Final thoughts
Choosing and using student responses

• Always say something positive
  • This is true, but what if something else occurs simultaneously…
  • This makes sense, but something is missing…
  • This is a great response… how would we know how much heat to add?
  • This is correct, but the reasoning isn’t quite right…
  • This has a great beginning, but more could be added…
Choosing and using student responses

• Peer Instruction/Think-Pair-Share
  • Question 3 on the last warmup was pretty tough. Now that we’ve talked about it, let’s do it again with clickers (or cards!)
  • Here’s a clicker question based on the warmup
  • Here are three answers to last night’s warmup, which is the best?
Choosing and using student responses

“A student gives a warmup response that is seriously incorrect, indicating a deep misunderstanding of the topic. In your opinion, the best thing to do is to…”

a. **Point out the mistake in class: 44%**
b. **Contact the student by email: 7%**
c. **Either, and give zero points: 5%**
d. **None of the above: 44%**
Why?

- astro137:” Email could be sent, but it would be better if after in class, if the student is still showing a deep misunderstanding. Immediately after the warmup is too soon.”
- Brad: “It's likely that more than one student has the same misconception. This could be addressed to the whole class without naming the student.”
- Skip: “…if this was the case that just one student misunderstood and everyone else seemed to understand, I would try to more individually…”
Tips and Pitfalls

• Explain methods and purpose on first day
• No need to review all responses before class: sample for “useful” quotes, grade later
• Focus on students strengths, too, not just misconceptions and other problems.
• Use answers from many students: not favorites.
• Do not “isolate” warmups – use throughout session
• Must be routine. Don’t start/stop mid-semester
• Upper level students can handle more “exploratory” questions, connections to prerequisites
• Faculty cedes some control!
Results

• Students better prepared for class
  • Familiar with jargon
  • Given thought to ideas
• Faculty better prepared for students
  • Misconceptions identified
  • Just in time adjustment to coverage
• Class time spent more productively
  • Students interact during class
Outline

• Implementation ✓
• Getting student great evaluations
• Final thoughts
How to get great student evaluations

• First five minutes are critical!
• Be a leader—college is hard, and students look to you for motivation, don’t disappoint them.
• Build a team—let students know that you and they are working towards a common goal.
• Earn trust—take time on the first day of class to explain what you are doing and why.
• Hold yourself and your students to high standards—if you work hard, they will too.
Going Deeper:

- Completely hands on
- Writing warmup assignments
  - Planning the assignment
  - Writing questions
- Using student responses
  - What to say
  - How to say it
Summary

• JiTT is based on feedback between homework and classroom
• WarmUp exercise: a pre-class, online reading quiz
• Improved study habits, retention, content knowledge, morale.
• Instructor knowledge of student difficulties
• Easily adopted and adapted
New Faculty Workshop
Chemistry example

This picture depicts matter at the submicroscopic level. Describe what you see and take a guess as to what the identity of the substance is.

- “The particles are well spaced out so I would guess the substance to be a gas. The substance is a gas composed of 2 elements that are in an equal ratio.”
- “After reading Chapter 1 in the book I would guess that the substance is water in the form of a solid because the atoms are in order. However, I could be wrong because I think the atoms in a solid might be closer together.”

Student Comments

• “This was a fantastic course. It was the hardest course I’ve taken yet, but also the most fun.”
• I think the WarmUps are a good idea because they give students a chance to think about the material prior to lecture.
• "This course was very well structured. It was obvious that a lot of time was spent in preparation for it.”
• "152 & 251 have made me reach more than any courses I have taken.”
• Don’t tell anyone, but I think I will greatly miss my physics class.
smartPhysics checkpoint

1. Two equal, but opposite charges are placed on the x axis. The positive charge is placed at to the left of the origin and the negative charge is placed to the right, as shown in the figure. What is the direction of the electric field at point A?
   a) up  b) down  c) left  d) right  e) zero

2. Explain your reasoning
smartPhysics output

Aaron (aaron@iupui.edu)
1) 4
2) the field from Q+ points up and to the right, while Q- points down and to the right therefore when adding them together it points to the right.

Beatrice (beatrice@iupui.edu)
1) 4
2) point A is equidistant from each charge and they would therefore cancel out

Ada (ada@iupui.edu)
1) 2
2) The charges will cancel out so the direction of the force will be down

Ahmed (ahmed@imail.iu.edu)
1) 4
2) the field is toward the negative charge and away from the positive charge which makes the direction to the right
