Welcome

*Transforming Undergraduate STEM Education*

**Our Central Goals:**

The UA-AAU STEM Education Project seeks to provide thousands of science and engineering majors at the University of Arizona with solid understanding in core STEM disciplines. For this purpose, we are engaged in the redesign of three foundational science courses (general chemistry, introductory biology, and introductory physics/mechanics) and two introductory engineering courses (elements of chemical engineering II and computer programming for engineering applications). The course redesigns are using student-centered and active learning pedagogy to enhance discipline knowledge and conceptual understanding. Three common themes cut across all redesign efforts: 1) promotion of information and quantitative literacy, 2) use of real-life applications in problem solving, and 3) use of models to develop conceptual understanding. The topics covered in the courses are being critically examined to emphasize core disciplinary ideas, problem-solving abilities, critical thinking, and teamwork, to ensure students are provided with a solid foundational understanding.
Insights from the Univ. of Arizona AAU STEM reform effort in Physics

**Reformed Class**
- Two 50 minute lectures per week
  - Focused on introducing concepts using active engagement instructional strategies and on collaborative group problem solving
  - Minimal derivations of equations
- Each student also attends a 50 minute recitation sections per week
  - Led by graduate TA with assistance from undergraduate peer instructors
  - Students work on collaborative tutorials, which promote reasoning abilities and problem solving skills
- Instructor experienced in astronomy and physics education research, but teaching PHYS 141 for the first time

**Traditional Class**
- Three 50 minute lectures per week
  - Focused on introducing concepts and on instructor-led modeling of problem solving
  - Many derivations of equations
- Instructor experienced in teaching PHYS 141 and widely regarded by faculty and students as an excellent lecturer
Chapter 6: Work and Kinetic Energy

The work $W$ by the force on the object is given by

$$W = \vec{F} \cdot \vec{d} = Fd \cos(\theta)$$

SI unit of work: Joules (J)

A constant force $\vec{F}$ is applied to an object. The object has a straight-line displacement $\vec{d}$.

The work $W$ by the force on the object is given by

“dot product”
aka “scalar product”
(see Section 1.10)

Force and displacement are vectors, but work is a scalar.
When a force (or component of a force) points in the **same direction** as the displacement, the work done by that force is **positive** ($W > 0$).

When a force (or component of a force) points in the **opposite direction** as the displacement, the work done by that force is **negative** ($W < 0$).

When a force is **perpendicular** to the displacement, the work done by that force is **zero** ($W = 0$).
In the cases below (1-5), identical particles experience the same displacement. The forces shown acting on the particles all have the same magnitude. Rank each case based on the work done on the particle, from most negative to most positive.

A) 1, 3, 5, 2, 4
B) 5, 3, 4, 1, 2
C) 5, 3, 1, 4, 2
D) 4, 2, 5, 3, 1
E) None of the above.
When many forces act on an object, we can calculate the work done on that object by each of those forces.

The sum of all of these works is called the net work \( W_{net} \).

A 3.0 kg box starts from rest and slides for 2.0 m down a 30° incline. The coefficient of static friction between the box and the incline is \( \mu_k = 0.1 \). Find \( W_{net} \).
A 3.0 kg box starts from rest and slides for 2.0 m down a $30^\circ$ incline. The coefficient of static friction between the box and the incline is $\mu_k = 0.1$. Find $W_{\text{net}}$. 
Which of the following is the correct free-body diagram for the box?
A 3.0 kg box starts from rest and slides for 2.0 m down a 30° incline. The coefficient of static friction between the box and the incline is $\mu_k = 0.1$. Find $W_{net}$.

Is the work done by the normal force ($W_N$) on the box positive, negative, or zero?

A) positive  
B) negative  
C) zero  

$W_N = (N_{IB})(d)\cos(90°) = 0 J$
A 3.0 kg box starts from rest and slides for 2.0 m down a 30° incline. The coefficient of static friction between the box and the incline is $\mu_k = 0.1$. Find $W_{\text{net}}$.

Is the work done by the friction force ($W_f$) on the box positive, negative, or zero?

A) positive  
B) negative  
C) zero
A 3.0 kg box starts from rest and slides for 2.0 m down a 30° incline. The coefficient of static friction between the box and the incline is $\mu_k = 0.1$. Find $W_{net}$.

Is the work done by the weight force ($W_W$) on the box positive, negative, or zero?

A) positive  
B) negative  
C) zero
A 3.0 kg box starts from rest and slides for 2.0 m down a 30° incline. The coefficient of static friction between the box and the incline is \( \mu_k = 0.1 \). Find \( W_{\text{net}} \).

Work done on box by friction force: 
\[
W_f = (f_{IB})(d)\cos(180°) = -(f_{IB})(d)
\]

\( f_{IB} \) is given by which of the following?
A 3.0 kg box starts from rest and slides for 2.0 m down a 30° incline. The coefficient of static friction between the box and the incline is $\mu_k = 0.1$. Find $W_{\text{net}}$.

Work done on box by friction force: $W_f = (f_{IB})(d)\cos(180°) = -(f_{IB})(d)$

$f_{IB}$ is given by which of the following?

A) $\mu_k mg \cos (30°)$
B) $\mu_k mg \sin (30°)$
C) $\mu_k mg \cos (60°)$
D) $\mu_k mg$
E) More than one of the above.
A 3.0 kg box starts from rest and slides for 2.0 m down a 30° incline. The coefficient of static friction between the box and the incline is \( \mu_k = 0.1 \). Find \( W_{\text{net}} \).

The work done by the weight force (\( W_W \)) is given by which of the following?
A 3.0 kg box starts from rest and slides for 2.0 m down a 30° incline. The coefficient of static friction between the box and the incline is \( \mu_k = 0.1 \). Find \( W_{net} \).

The work done by the weight force \( (W_W) \) is given by which of the following?

A)  \( mg \ d \)
B)  \( mg \ d \sin (60^\circ) \)
C)  \( mg \ d \cos (30^\circ) \)
D)  \( mg \ d \cos(60^\circ) \)
E)  More than one of the above.
A 3.0 kg box starts from rest and slides for 2.0 m down a 30° incline. The coefficient of static friction between the box and the incline is $\mu_k = 0.1$. Find $W_{\text{net}}$.

What is the net work ($W_{\text{net}}$) done on the box?
A 3.0 kg box starts from rest and slides for 2.0 m down a 30° incline. The coefficient of static friction between the box and the incline is $\mu_k = 0.1$. Find $W_{net}$.

What is the net work ($W_{net}$) done on the box?

A) 34.5 J  
B) 29.4 J  
C) 24.3 J  
D) 5.1 J  
E) None of the above.
A 3.0 kg box starts from rest and slides for 2.0 m down a 30° incline. The coefficient of static friction between the box and the incline is \( \mu_k = 0.1 \). Find \( W_{\text{net}} \).

\[
W_N = (N_{IB})(d)\cos(90°) = 0 \, J
\]

\[
W_f = (f_{IB})(d)\cos(180°) = -(\mu_k)(mg \cos(30°))(d) = -5.1 \, J
\]

\[
W_W = (W_{EB})(d)\cos(60°) = (mg)(d)\cos(60°) = 29.4 \, J
\]

\[
W_{\text{net}} = W_N + W_f + W_W = 0 \, J - 5.1 \, J + 29.4 \, J = 24.3 \, J
\]
COPUS data from UA Calc-Physics Reformed Course

Instructor Doing (50-min. class)

- Lecturing: 22%
- Follow Up to Activity: 12%
- Posing Questions: 10%
- Polling Question: 16%
- Answering Questions: 3%
- Moving/Listening to Groups: 21%
- Moving/Guiding Groups: 13%
- Administrative Tasks: 3%
